                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel method for obtaining typing information about several variable sites within target nucleic acid, or typing one or more nucleic acid molecules. The methods of the invention are useful for typing one or more nucleic acid molecules containing two or more variable sites, preferably nucleic acid molecules containing two or more variable sites are typed, where three or more primer extension reactions are performed. The method is also useful for diagnosis of pathological conditions characterized by the presence of specific nucleic acid molecule(s). The methods are particularly suited for identifying microbals species or their subtypes, and in typing procedures e.g. typing of polymorphisms, tissue typing or in clinical applications. The sequence specific target region of genomic DNA

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ3 is concoded at chromosome 7422.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome corrections of manufacturing a medicament for treating or preventing a disorder sesociated with MDZ1, MDZ7, and MDZ12 sequences are useful in therapy, or imanufacturing a medicament for treating or preventing a disorder sesociated with MDZ12, e.g. cancer or developmental disorders. The nucleic acused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as protein are useful as therapeutic agents for gene therapy or as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ1, MDZ1, MDZ2, MDZ3, Encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome form DZ3 is encoded at chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ4; MDZ12; chromosome 7g22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15g26.1; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 257
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ADA99491
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12. MDZ3 is encoded at chromosome 6P21.3-22.2, MDZ7 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ1, and MDZ12 sequences are useful in therapy, or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene chreapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .;

15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The mucleic acids and proteins are also useful for disgnosting or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.

New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.

Example 8; SEQ ID NO 401; 103pp; English.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is encoded at chromosome 7922.1, MD24 is encoded at chromosome 1502.1.3-22.2, MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 15p11.2 or preventing at chromosome 15p2 is concided at chromosome 15p12.2 is encoded at chromosome 15p12.2 is and MD212 is encoded at chromosome 15p2.2 or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule immension immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-HER2, K-Ras, H-Ras, and HIV acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, blown in AbzS9889 - AbzG2216, AbzG4544 - AbzG5531, AbzG6520 - AbzG6524, AbzG6530 - AbzG6585 represent substrate/target sequences for the human Match 3.1%; Score 13.4; DB 1; Length 17; Local Similarity 80.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of gene chip, in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                               Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine; tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease;

The present invention describes a method for detecting lipid metabolism errors in patients using as indicators a set of 65 specific low density lipoprotein (LDI) receptor gene mutations. The method can be used in the diagnosis of an inherited predisposition to the development of diseases associated with hyperlipaemia, such as arteriosclerosis and ischaemic heart disease. ABL91141 encodes the LDL receptor given in ABB90525. ABL91142 to ABL91183 represent PCR primers used in the amplification of the receptor gene. ABL909090 to ABL91140 and ABB90445 to ABB90524 represents sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Set of specific low density lipoprotein receptor gene mutations for diagnosis of familial lipid metabolism errors including hyperlipemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Σ

encoding minK protein and KVLQT1 protein involved channel formation useful for screening drugs, for

forms of genes

Ĥ

Splawski

Sanguinetti MC,

```
The invention relates to KVLQT1 and KCNE1 genes, associated with long QT (LQT) syndrome. It provides a mink protein comprising a mutation which substitutes the wild type amino acids with Leu, Asp, Leu, His, Trp and Al ao Thr ar residues 74,76,28,32,98 and 127 respectively. Screening KVLQT1 and KCNE1 is useful for identifying mutations for diagnosing and treating LQT. The ability to predict LQT enables physicians to prevent the diseases with medical therapy such as beta blocking agents and opts for better treatments. Sequences AAZ90675-Z90706 represent human KVLQT1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human long QT syndrome-associated KVLQT1 exon 5/intron 5 boundary.
                                                                                                                                                                                                                                              Sequence 20 BP; 2 A; 8 C; 8 G; 2 T; 0 U; 0 Other;
                                                                  in cardiac potassium channel formation use:
preventing and treating cardiac arrhythmia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             KVLQT1; mutation; human; cardiac I(k8)

The invention relates to KVLQT1 nucleic acids which have a mutation compared to wild-type KVLQT1 (AAZ98901) The KVLQT1 gene encodes a protein of 676 amino acids which forms a cardiac I(ks) poteassium channel with the KCNE1 protein (AAY80563). The KVLQT1 gene contains 15 introns and encodes a protein containing 6 putative transmembrane segments and a pore forming region. The gene has been mapped to the chromosomal location 11p15.5. The sequences AAZ98905-28935 represent the intron-exon boundaries from the KLVLQT1 genomic sequence. Mutations in the KVLQT1 or KCNR1 genes result in cardiac arrhythmias observed as a prolonged QT curve in electrocardiograms (Long QT syndrome). The genes and proteins can be used for the diagnosis of subjects with long QT syndrome. They can also be used to screen for drugs which can be used for treating or preventing long QT syndrome. The KVLQT1 nucleic acids can be used for gene therapy, Human, ss; PARP; Poly (ADP-ribose) polymerase; antisense oligonucleotide; cytostatic; nootropic; neuroprotective; antinfilammatory; antidiabetic; immunosuppressant; hyperproliferative disorder; cancer; cellular injury; oxidative stress; neurological disorder; parkinsonism; apoptosis; meningitis-associated intracranial complication; ischaemia; probe; inflammatory disorder; authritis; diabetes. New isolated mutant KVLQT1 nucleic acids, useful for developing products for the diagnosis, prevention and treatment of long QT syndrome. The invention relates to antisense oligonuclectides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly And PARP) and inhibiting expression of human PARP. PARP (Poly decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonuclectide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, environgations and ischaemia), inflammatory and autoimmune disorders (e.g arkinsonism, meningitis-associated intracranial complications and ischaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is an antisense oligonucleotide of the invention
                                                                                                                                                                                                                                                                             Antisense compound useful for treating hyperproliferative, neurological, inflammatory and autoimmune disorders and diabetes inhibits human PARP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 20 BP; 3 A; 7 C; 7 G; 3 T; 0 U; 0 Other;

DNA encoding for a mutant KVLQT1 which causes Jervell and Lange-Nielsen syndrome (JLN) when homozygous, useful for diagnosing long QT syndrome, or diagnosing or prognosing JLN.

Example 5; Col 45-46; 58pp; English

KVLQT1 is a cardiac potassium channel and mutations in the KVLQT1 gene cause Jervell and Lange-Nielsen Syndrome (JLN). KVLQT1 maps to chromosome lip15.5. The present invention relates to a mutant KVLQT1 coding sequence (see AAC89914). The mutant KVLQT1 coding sequence is useful in the presence diagnosis of long off syndrome and in screening humans for the presence of KVLQT1 gene variants which cause JLN syndrome. The present sequence is an exon/intron boundary of KVLQT1 XXXXXXXXXXXXXXXXX

Detection method of Pseudomonas bacteria. WPI; 2001-605311/69.

Claim 9; Page 8; 11pp; Japanese.

The present invention relates to a method for the detection of the 163/23SrRNA spacer region of Pseudomonas putida (see AAI69774). The method can be used to detect Pseudomonas bacteria. The present sequence is a PCR primer which was used in an example from the present invention

caspase 6 antisense inhibition related oligo SEQ ID No 120.

Synthetic

```
The present invention describes a method (M1) for designing capture oligomucleotide probes (I) for use on a support to which complementary oligomucleotide probes (II) will hypridise with little mismatch, where coligomucleotide probes (II) will hypridise with little mismatch, where coligomucleotide probes (II) will hypridise with little mismatch, where coligomucleotide albeit is the method is useful to detecting infectious diseases caused by bacterial infectious agents consistent infectious agents consistent infectious agents consistent infectious agents consistent in the management of the present of the method is useful for detecting genets cirus, selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus consistent of method is also useful for detecting genetic diseases such the method is also useful for detecting genes or genes concer involving oncogenes, tumour suppressor genes, or genes betecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, muman papillomavirus types 16 and 18 and 11 ver cancers. The confident is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning celectron microscope and infrared microscope) the support at the food confident is also used for environmental and croscope) the support at the food confident in the support at the confident of particular sites and identifying if ligation of the oligomucleotide sequences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an antisense oligonucleotide compound of 8 to 50 nucleotides in length that is targeted to a nucleic acid molecule encoding caspase 6, where the oligonucleotide specifically hybridises with and inhibits the expression of caspase 6. The oligonucleotide of the invention specifically hybridises to and inhibits expression of caspase 6 invention specifically hybridises to and inhibits expression of caspase 6 therappeutically or prophylactically to treat an animal having a disease or condition associated with caspase 6, such as Rieger's syndrome or axaxia telangiecrasia, hyperproliferative disorder, a haematopoietic disorder, a bone metabolism or cholesterol disorder, a haematopoietic disorder, a bone metabolism or cholesterol disorder, various types of cancer neurological conditions such as Alzheimer's disease and other deregulated apoptoric pathological conditions. This polynucleotide sequence represents a mouse caspase 6 oligonucleotide relating to the invention. NOTE: This phosphorothioate oligonucleotide sequence has 2' MOE wings and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; K-ras; PCR primer; probe; capture probe; mutation detection; ligase detection reaction; LDR; p53; BRCAl; BRCA2; infectious disease; infection; 21 hydroxylase deficiency; Turner Syndrome; obesity; cancer; oncogene; tumour suppressor; human papillomavirus; forensic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
    The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in atrisense gene therapy. The composition may have a cuse in atrisense gene therapy. The composition may have a cuse in atrisense gratery in a subject, for reducing or depleting levels of for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of creceptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject, a tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Once: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at the composition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                     Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

PCR primers ABV72389-ABV72416 were used to amplify exons of the human Artemis gene. This gene encodes a V(D)J recombination and/or DNA repair factor that belongs to the metallo beta-Lactamass enperfamily, and whose mutations give rise to the human RS-SCID condition. The gene is localised to chromosome 10. The Artemis gene or its nucleic acid is useful for diagnosing or treating severe combined immunodeficiencies (SCIDs) or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CNS; conserved non-coding region; 88; cytokine; interleukin 4; IL-4; interleukin 5; IL-5; interleukin 13; IL-13; chromosome 5q31; LCR; PCR; locus control region; interleukin gene cluster; transcription factor; human; mouse; dog; rat; bovine; pig; rabbit; fruitfly; puffer fish;

```
The invention relates to an isolated nucleic acid molecule comprising a length of about 100 nucleotides of less, which has a sequence at least about 100 nucleotides of less, which has a sequence (CNS)-1 sequence (a locus control region (CRS) element in interleukin gene (CNS)-1 sequence (a locus control region (CRS) element in interleukin gene (CNS)-1 coluster region of chromosome 5431 containing interleukin (IL) 4, ILS and (CNS-16 or mouse CNS-16 or their complements. Also included are: (1) an expression cassette comprising a CNS-1 sequence operably linked to a promoter which controls transcription of a heterologous coding sequence (CNS-16 or mouse CNS-1 sequence) (3) an expression cassette consisting a cesentially of an IL-4 gene, an IL-13 gene, and a CNS-1 sequence flanked between two recombination site sequences; (3) an expression cassette comprising an IL-4 gene and an IL-13 gene, and lacking a CNS-1 sequence; (5) a T cell comprising one of the expression cassettes; (6) a non-human transgenic caninal where a CNS-1 sequence; (5) a T cell; animal comprising one of the expression cassettes or the T-cell; and (7) a non-human transgenic animal where a CNS-1 sequence is deleted from its chromosome. The T cell is useful for identifying a compound that compound on binding of the transcription factor to a CNS-1 sequence of the CNS-1 sequence of the CNS-1 sequence of the CNS-1 sequence of the compound on binding of the transcription factor of a compound. The nucleic acid is useful for modulating expression cassettes is compound. The nucleic acid is useful for modulate functions of CNS sequence of the CNS-1 sequence of the CNS-1 sequence of the compound of the modulate functions of CNS sequence.

Compound: The nucleic acid is useful for modulate functions of CNS sequence of the CNS-1 sequence and that a diagnostic tool to screen patients having consecuted to cytokine gene expression. Expression cassettes with and without CNS are identifying compounds that modulate and the compound of a serial expression cassettes and 
                                                                                                                                                                                                                                                                                                                                                             Novel isolated nucleic acids which are locus control region elements in interleukin gene cluster region of chromosome, referred as conserved non-coding sequences, useful for modulating expression of cytokine genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, ARTEMIS protein, V(D)J recombination, DNA repair; gene therapy, severe combined immunodeficiency; SCID; cancer; exon 1, PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     degenerate PCR primer used to isolate a CNS sequence from a variety of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              various therapeutic modalities. The invention relates to an Artemis nucleic acid coding for a protein involved in V(D)J recombination and/or DNA repair. Sequences of the invention are useful for treating severe combined immunodeficiencies (SCID) or cancer. They are also useful for diagnositing a patient, including a prenatal diagnosis with SCID, a predisposition to cancer, an immune deficiency or a carriage of a mutation increasing the risk of progeny to have such a disease. Peptides of the invention are used for preparing antibodies. The invention is useful in gene therapy. The present sequence is a PCR primer used to amplify human Artemis exon 1 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HLA; polymerase chain reaction; inflammatory arthropathy; susceptibility;

셤 ઠે žS ਨੇ 셤 The sequence is that of a probe which hybridises to one of the human leukcyte antigen (HLA) sequences in the primer extension products (or strands) produced during PCR amplification of the HLA class I alleles. It is specific for the sequence encoding amino acids 67-71 (CKAKA) of the alpha 1 domain of the HLA-B27 group and is thus specific only for this group. It can be used in the detection and/or identification of an HLA sequence that may be indicative of a patients succeptibility to inflammatory arthropathy such as arthritis and arthritis related diseases. Such diseases include reactive arthritis, rheumatoid arthritis, Reiter's syndrome, uveitis, viral arthritis, psoriatic arthropathy, gouty arthritis, septic arthritis, erythema nodosum, Henoch-Schloelein purpura and esp. ankylosing spondylitis. See also AAQ24895-Q24902. (Updated on 25-WAR-2003 to correct PV field.) ö Sets of PCR primers (see AAQ56835-Q56857) are used as probes to detect Norwalk-related viruses, e.g. SRSV/KY/89, HuCV Sapporo, HuCV Houston and primate calcivirus. Detection of viral RNA is by RT-PCR. (Updated on 25-MAR-2003 to correct PN field.) DNA from Norwalk and related viruses - used for preparing prods. for use in diagnostic assays, detection and vaccines for Norwalk and related amplification of nucleic acids using buffer soln. and chelating agent or detecting HLA class I alleles for determining susceptibility to Norwalk virus; HuCV; Sapporo; pathogen; acute gastroenteritis; food poisoning; seafood contamination; diagnostic assay; PCR primer; human calcivirus; small round virus; polymerase chain reaction; ss. Deletion analysis of oligonuclectide 1, generating oligonuclectides 2-6 (AAQ87129-33), indicates that sequences responsible for activation, in addition to the cognate recognition site, are located within 8-10 bases of either side of the Nael site. (Updated on 25-MAR-2003 to correct PF field.)

Primers and probes AAT01515-40 and AAT16978-87 are used in a novel method for the specific detection of human herpes viruses (HHV) in which at least two types of HHV nucleic acids are pre-amplified by at least 4 primers, followed by a separate detection step using specific detection probes. The primers and probes are synthesised based on the sequences of at least 8 HHV strains selected from HSV1, HSV2, VZV, EBV, CMV, HHV-6A, HHV-6B and HHV-7. They are split into 3 groups: A, B or C. Similarly the probes are split into 3 groups: A', B' and C'. The probes are specific in that they will only detect the amplification prods. from that virus by sandwich hybridisation. This primer is derived from Epstein-Barr virus by and cytomegalovirus (CMV) sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         An oligonucleotide for the amplification and the specific detection of Epstein-Barr virus (EBV) and cytomegalovirus (CMV) - useful for detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Q876296-Q876303 are PCR primers used in a new method for the amplification and specific detection of Epstein-Barr virus (EBV) and cytomegalovirus (CMV). The oligonucleotides are useful for the detcting the EBV and CMV genes from a culture supernatant of herpes virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The oligonucleotides AAQ92471-86 can be used for the detection of cytomegaloviruses in a hybridisation assay. The oligonucleotides may be modified by labelling with radioisotopes, fluorescent compounds, enzymes, nucleotides with linker arms, biotin or the promoter sequence for an RNA polymerase. The oligonucleotides may be optionally immobilised
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Primer, PCR, amplification, probe, human, herpes virus, cytomegalovirus, herpes simplex virus, varicella zoster virus, Epstein-Barr virus,

AAX09121-X1026B are allele-specific oligonucleotide primers used in the isolation of various biallelic polymorphic markers found in the human genome (represented in AAX10269-X12937). These primers can be used in a
                                                                                                                                                                                                                                  forms (AAT41710-13) of the murine major histocompability complex
                                                                                                                                                                                                                                      Mutated forms (AAT41710-13) of the murine major histocompability complex interferon-stimulated response element (MMC IRSE) binding sequence (AAT41709), along with other 'competitor' DNAs (AA73174-16), were used in gel shift assays designed to determine whether mouse lymphocytenespecific interferon regulatory factor (LSIRF) (see also AAR99426) is a DNA binding protein. Mutant misRE mutant mt4 (AAT41713) competed well with wild-type MHC ISRE for binding to LSIRF protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polymorphism, biallelic; human; forensic; paternity testing; disease; detection; phenotypic typing; characteristic; infection; hereditary; autoimmune disease; cancer; inflammation; drug; therapy; medicament; treatment; marker; primer; ss.
                                                                                                                                          New genes for murine lymphocyte specific interferon regulatory factor used for modulation of lymphocyte activation and proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid segments from the human genome - used for determining polymorphic forms for use in e.g. forensics, paternity testing or phenotypic typing for disease.
                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

New polynucleotides encoding secreted human proteins potentially useful as, e.g. immunostimulators.

Disclosure; Page 96; 99pp; English.

The present invention describes human secreted proteins obtained from human fetal brain, fetal Kidney or adult blood cDNA libraries. The present sequence represents a probe for a human secreted protein. The human secreted proteins, and polynucleotides encoding them, are predicted human secreted proteins, and polynucleotides encoding them, are predicted

to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, haematopoiesis regulating activity, tissue growth haemacotatic, chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, and tumour inhibition activity. The polynucleotides are also stated to be
                                                                                                                                                                                                                                                                                                                                                                                                                                                       G-alpha-13; human; inhibitor; cancer; antisense compound; therapy; ss.

ö This sequence represents an antisense inhibitor of the invention, and inhibits the expression of the human G-alpha-13 protein. The antisense compounds of the invention are of 8 to 30 nucleobases in length, that inhibits the expression of the human G-alpha-13. The antisense compound is useful for treating an animal, particularly humans, having or being prone to a disease or condition associated with the expression of G-alpha-13, such as cancer Gaps ö Score 13.2; DB 1; Length 18; Pred. per primers AAZ66571-72 were used to amplify cDNA encoding a neurotrophic factor designated neublastin. Neublastin is a member of the glial cell line-derived neurotrophic factor sub-class of the transforming growth factor-beta superfamily of neurotrophic factors. Neublastin exhibits high affinity for the GFR-alpha3-RET receptor complex. The polypeptides can be used for treating a neurodegenerative disease or disorder, certebral ischemic neuronal damage, traumatic brain injury, peripheral neuropathy. Alzheimer's disease, Huntington's disease, Parkinson's disease, Parkinson also plus syndromes, progressive Supranuclear Palsy, Olivopontocerebellar etrophy, Shy-Drager Syndrome, Guamanian parkinsonism dementia complex, amyotrophic lateral solerosis, memory impairment, or a neuronal disorder of the peripheral nervous system, the medulla or the spinal cord. They can also be used for treating various neuropathies. They can also be used for treating various neuropathies. They can also be used for treating various neuropathies. They can also be used for treating ischemic stroke, acute brain injury, acute spinal cord injury, nervous system tumours, multiple sclerosis, exposure to neurotoxins, metabolic diseases such as diabetes or renal dysquincions in his events. and damage caused by infectious agents, or various disorders in the eye

Sequences AAZ49796-Z59835 represent antisense oligonuclectides targetted to the human Smad3 gene, which inhibit its expression. The antisense oligonuclectides were designed to target different regions of the human condainment of the condainment of the smad state. The smad protein are a family of the human condains which are involved in TGF-bets superfamily signal transduction. To proteins which are involved in TGF-bets superfamily of cytosolic on ligand binding, TGF-bets superfamily proteins (such as bone con ligand binding, TGF-bets superfamily proteins (such as bone con phosphorylate Smad proteins which then home or heterodimerise and translocate to the nucleus to activin and TGF-bets themselves) con translocate to the nucleus to activite target gene transcription. Smad3 carrials transcription factors, the pathway-restricted Smads, which are consulated by TGF-bets and activitae transcriptical Smad4 (USc013787-A, AAY69622), the complex being able to activate TGF-bets inducible transcription. The oligonucleotides of the invention are useful conditions associated with smad4 conditions approached by the are tumour formation, inflammation and certain

The invention relates to novel human secreted proteins, the nucleic acids encoding them. The protein may exhibit cytokine, cell proliferation or cell differentiation activity or may induce production of other cytokines in certain cell populations and may exhibit immune stimulating or immune suppressing activity, which is useful for the treatment of various immune deficiencies and disorders e.g. severe combined immunodeficiency (SCID), autoimmune disorders e.g. multiple sclerosis, systemic lupus crythematosus, rheumatoid arthritis, autoimmune pulmonary inflammation. The proteins are also useful in the treatment of diseases and disorders including tissue, skin and organ transplantation and in graft-versue-host including tissue, skin and organ transplantation and in graft-versue-host cliseases (GVBD), in the induction of tumour immunity, myeloid or lymphoid cell deficiencies, wound healing and tissue repair, in the treatment of burns, inclsions and ulcers, as well as in treatment of pariodontal disease, osteoporosis or osteoarthritis, mediated by inflammatory processes, diseases, Huntington's disease, amylotrophic lateral central nervous system vessel e.g. stroke, sepsis, inflammatory bowel disease, ulcers, bone regeneration. The protein, having activin- or inhibin-related activities is useful as a contraceptive based on the ability of inhibins male mammals. The proteins and nucleic acids are also spermatogenesis in male mammals. The proteins and nucleic acids are also spermatogenesis in male mammals. The proteins and nucleic acids are also

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an SCR (Sequence Characterised amplified Regions) primer for distinguishing Korean beef meat from milk cow meat. The SCR primer distinguishes between the two quickly and accurately. The current sequence represents an SCR primer for distinguishing between beef
probe used to detect the nucleic acids of the invention and where an N residue is present at position 2 this is a biotinylated phosphoroamidite residue
                                                                                                                                                                                                                                                                                                                primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

        The invention relates to a truncated neublastin polypeptide comprising an amino acid terminus that lacks one or more amino-terminal amino acids of a mature neublastin polypeptide. The polypeptides and mucleic acids are useful for treating neurodegenerative disorders such as ischemic neuronal damage, traumatic brain injury, peripheral neuropathy, neuropathic pain, Alzheimer's disease, Huntington's disease, Parkinson's disease, amyotrophic lateral sclerosis, memory impairment, diabetes, renal diseases, or glaucoma by moderating metabolism, growth, differentiation or survival of a nerve or neuronal cell. This polynucleotide sequence is a neublastin PCR primer of the invention

```
The present sequence represents a specifically claimed oligonucleotide PCR primer. The oligonucleotide can be used for polymerase chain reaction (PCR) amplification of DNA, specifically regions of specific genes that are conserved among mammalian species, i.e. pairs of oligonucleotides from the present specification represent universal mammalian sequence-tagged site (UM-STS) primers. The primers are used to develop genomic maps, to isolate clones from libraries, to make cross-species comparisons and to develop additional genetic markers. UM-STS allow genomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New oligonucleotide primers amplifying gene regions conserved among mammals - useful for developing genomic maps, isolating clones and making cross-species comparisons.
endotoxin lethality, arthritis, inflammatory bowel disease or Crohn's disease; or tumours or cancers, pemphigus vulgaris or pemphigus foliaceus. The present sequence is that of a biotinylated oligonucleotide with a phosphoaramidite residue, useful to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PCR primer; polymerase chain reaction; amplification; UM-STS; universal mammalian sequence tagged site; genomic map; clone; ss.

Also described are: (1) a DNA having transcription inducing activity with stress on endoplasmic reticulum containing the above mentioned element, optionally further containing a promoter DNA, and (2) a vector containing the element can be used for the inhibition of growth and induction DNA. The element can be used for the inhibition of growth and induction dispasses and cystic fibrosis by inhibition of symptoms of canter cells, and improvement of symptoms of canter can be used for the inhibition of symptoms of autoimmune diseases and cystic fibrosis by inhibition of autoantibody formation.

An endoplasmic reticulum stress transcription factor (bZIP) capable of regulating transcription inducing activity exhibited by an element (ERSE) can be used in a method for controlling expression of an endoplasmic reticulum chaperone. The method comprises expression bZIP. The method can be used for expression of a foreign protein by positively regulating expression of an endoplasmic reticulum chaperone gene. bZIP is useful for controlling the expression of endoplasmic reticulum chaperone either positively or negatively in cells and therefore is useful for treatment or prophylaxis of ancers, arteriosclerosis, cystic fibrosis, ischaemic diseases, wounds and ulcers. bZIP also maintains the correct conformation of the endoplasmic reticulum chaperone and thereby increases the expression of a foreign protein. This sequence taken from the glucose regulating protein (GRP) promoter GRP94 contains an BRSE like sequence. (Updated on 15-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; protein kinase; PTK; STK; cancer; cardiovascular disease; SNP; metabolic disorder; immune related disease; neurological disorder; neurodegenerative disorder; inflammatory disorder; infectious disease; reproductive disorder; gene therapy; single nucleotide polymorphism; ds
                                                                                                                                                                                                                                                                                                                                          New endoplasmic reticulum stress transcription factor (known as bZIP) fr
controlling expression of endoplasmic reticulum chaperone, useful for
treating cancers, arteriosclerosis, cystic fibrosis, ischemic diseases,
wounds and ulcers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 19 BP; 4 A; 9 C; 5 G; 1 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SNP containing protein kinase DNA sequence #54.

AASO6832-AASO6897 represent part of a polymucleotide sequence encoding for novel human protein kinases where a single nucleotide polymorphism (SNP) has been identified. The SNP occurs at the last position of the present sequence. The sequences are described relating to the invention of novel human protein kinases #1-57 (AAU03501-AAU03557). The novel correction kinase (PTK and STK) families. The polymorleotides serine/threonine kinase (PTK and STK) families. The polymorleotides canceding protein kinase and the polymorphies. The polymorleotides prevention, diagnosis and treatment of diseases associated with prevention, diagnosis and treatment of diseases associated with cancers (especially cancers of harmatopic-tic origin), cardiovascular cancers (especially cancers of harmatopic-tic origin), cardiovascular disease (e.g. atherosclerosis), metabolic disorders (e.g. diabetes), immune related diseases (e.g. rheumatoid arthritis), neurological fiscances (e.g. disease), inflammatory disorders (e.g. asthma), infectious disease (e.g. HIV) and reproductive disorders (e.g. asthma), infectious therefore the pranty and as NDA protein kinases may be used for the pharmary and as NDA protein disperse may be used for the pharmary and as NDA protein disperse may and parmoral associated when protein kinase may are parmoral parameters.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        gene therapy and as DNA probes in diagnostic assays. The protein Kinase polypeptides may be used as antigens in the production of antibodies against the protein kinases and in assays to identify modulators of
                                                                                                                                                                                                                Nucleic acids encoding human kinase polypeptides, useful for preventing diagnosing and/or treating e.g. cancer, immune, cardiovascular and neuronal-associated diseases, and microbial infections.

The invention relates to a method for determining whether an individual is likely to be susceptible to malignant melanoma, and determining the genetic basis for the melanoma in an individual. The method involves screening the genome of the individual for the presence or absence of one or more polymorphic variants of the XRCC3 gene. Sequences AAH47412-420 represent PCR primers used in a genotyping assay of a candidate DNA repair gene XPD
                                                                                                                                     The present invention relates to the H gene derived from canine distemper virus (see AAF86567). The H gene sequence can be used in the prevention, treatment and detection of mammalian distemper, particularly canine distemper virus (CDV). The present sequence is a PCR primer, which was used in the present invention
                                                        H gene, used for treating, preventing and detecting mammalian distemper, particularly canine distemper viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Determining the susceptibility of an individual to malignant melanoma, involves screening the genome of the individual for the presence or absence of one or more polymorphic variants of the XRCC3 gene.
                                                                                                                                                                                                                                                                                                 Gaps

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (b) clones of the genomic libraries contained in method comprises: (b) a primer designed based on the chromosome marker comultiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is defected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell containing the clones in the mixed respecified to a call tured and the resultant cultures are amplified by using the above primer; (g) signals resultant cultures are amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The reconstituted as the positions on the chromosome and arrayed. The represent PCR primers for human chromosome 1956-35 DNA, and ABL45223 to ABL45231 to ABL45231 to C specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                  ABZ97252;
```

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intitation coodon, coding regalon, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entithflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antientlammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of, or reducing sensitivity to adenosine, reducing levels of, or reducing sensitivity to adenosine, reducing levels of ubiquinone or lung surfactant in a subject's tissue, or treating pronchoorseriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed appearance in the printed appearance in the printed appearance in the printed appearance of the sequence data for this patent is not represented in the printed appearance in the printed appearance for this form when the printed and the

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an continifiammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a comparing a respiratory, lung or mallgnant crespicatory effect of an continifiammatory steroid in a subject, for reducing or depleting levels of or entiantflammatory steroid in a subject, for reducing or depleting levels of continifiammatory steroid in a subject, for reducing levels of adenosine continity producing bronchodilation, increasing levels of adenosine contriblemmation, lung allergies, or treating bronchoconstriction, clung inflammation, but was obtained in electronic format directly from WIPO at the subject is a respiratory disease or condition.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô
                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel isolated double stranded RNA oligomucleotide about 19 to about 25 ribonucleotides in length or its equivalent. One strand of the oligomucleotide comprises the same nucleotide sequence as a region of a hepatitis C virus (HCV) target polymucleotide sequence required for hepatitis C virus infection, replication or pathogenesis in vitro or in vivo in a host cell. The oligomucleotide of the invention demonstrates virucide activity and may be useful for preparing a composition or vaccine for treating or preventing hepatitis C virus, as well as during gene therapy procedures. The current sequence is that of the anti-HCV agent LZ129 mutant RNA of the invention which contains a C3G mutation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         XXXXXX
```

```
The invention relates to a novel isolated double stranded RNA oligonucleotide about 19 to about 25 ribonucleotides in length or its equivalent. One strand of the oligonucleotide comprises the same nucleotide sequence as a region of a hepatitis C virus (HCV) target RNA polynucleotide sequence required for hepatitis C virus infection, replication or pathogenesis in vitro or in vivo in a host cell. The oligonucleotide of the invention demonstrates virucide activity and may be useful for preparing a composition or vaccine for treating or preventing hepatitis C virus, as well as during gene therapy procedures. The current sequence is that of the anti-HCV agent LZ129 mutant RNA of the invention which contains a G4C mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                          /*tag= a

To develop antisense oligos, the test system employed mouse NIH 3T3 cells stably transfected with an internally deleted construct of the human gene for the pro alpha 1(1) chains of type I procollagen COLLAI). A series of modified oligos were synthesised using a region at the 3' end of exch 1 and the first two nucleotides of intron 1 of the exogenous (human) gene as a target. This sequence is given in AAQ66555 which corresp. to bps 198 -225 if the adenine at the start of transcription is counted as poon. The corresp, which corresp to bps 169 199 months and the first the adenine at 10 pps 169 195 months are sequence of the endogenous (mouse) gene is given in AAQ66557, which corresp to bps 169 199. The antisense oligos are jiven in AAQ665597-Q66614. The antisense oligos inhibit the expression of mutant or normal collagen genes. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                             Anti:sense oligo:nucleotide(s) against mutant or native collagen genes for inhibiting collagen expression, e.g for treating osteoarthritis, liver cirrhosis, excessive scarring etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Colige A,

```
To develop antisense oligos, the test system employed mouse NIH 373 cells stably transfected with an internally deleted construct of the human gene for the pro alpha 1(1) chains of type I procollagen CCLIAI). A series of modified cligos were synthesised using a region at the 3' end of exon I and the first two nucleotides of intron 1 of the exogenous (human) gene as transpet. This sequence is given in AAG66555 which corresp. to bys 198 198 -225 if the adenthe at the start of transcription is counted as poon. The corresp, sequence of the endogenous (mouse) gene is given in AAG66559, which corresp to bys 169-195. The antisense oligos are given in AAG66559. Goodeld. The antisense oligos inhibit the expression of mutant or normal collagen genes. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A novel DNA construct (preferably a retroviral vector) has been produced for the treatment of human mammary cell disorders or diseases, including human mammary carcinoma. The DNA construct comprises at least one therapeutic gene under the transcriptional control of the whey acidic
                                                                Anti:sense oligo:nucleotide(s) against mutant or native collagen genes for inhibiting collagen expression, e.g for treating osteoarthritis, liver cirrhosis, excessive scarring etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gene expression; human mammary carcinoma cell; whey acidic protein; mouse mammary tumour virus; WAP; WMTV; polymerase chain reaction; 88
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           expression in human mammary carcinoma cells - using whey acidic in or mouse mammary tumour virus regulatory sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Murine leukaemia virus retroviral vector BAG PCR primer B.

```
A retroviral vector carrying a DNA sequence encoding SDI-1 (senescent cell derived inhibitor 1), a functional analogue, fragment or antisense SDI-1 DNA sequence has been developed. The present sequence represents FOT primer B used in the amplification of mouse leukaemia virus (MLV) retroviral vector beta galactosidase gene (BAG) LTR, for use in the cetroviral vector can be used in the treatment of a polylinker. The retroviral vector can be used in the treatment of disorders or diseases responsive to the anti-proliferative activity of SDI-1, e.g. for the treatment of cencer or restenosis, sepecially for the treatment of breast cancer. The retroviral vector acts to introduce the relevant DNA sequences, sense or antisense, into human cells in vitro or in vivo. The retroviral vector antistered by injection or by implantation of a packing cell ine in to the body nearby or at the site of the tumour. (Updated on 25-MAR-2003 to correct PI field.)
The present sequence represents PCR primer B which is involved in the deletion of the U3 region from the murine leukaemia virus (MLV) retroviral vector, known as BAG, and the insertion of a polylinker, which is used in an example for the production of a DNA construct as described above. The WAP and MMTV regulatory sequences are able to direct the mammary calls, including mammary carcinoma cells. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Retroviral vector carrying senescent cell derived inhibitor 1 DNA - used in the treatment of diseases responsive to anti:proliferative activity,

Lead in the chimeric non-human animal of the invention. The chimeric non-human animal of the invention. The chimeric non-human animal of the invention, preferably a mouse, contains a foreign chromosome (s) or chromosome fragment. The animal is produced by obtaining a hybrid cell by fusion of a cell containing the foreign chromosome with a repared, and fused with cells having differentiative pluripotency and containing the promosome. These cells are then introduced into an embryo, which is then chromosome. These cells are then introduced into an embryo, which is then chromosome segment to term. The foreign chromosome segment is at least in the long and preferably contains a region for an antibody. The chromosome segment could also contain genes associated with human chromas is useful for efficient production of proteins, especially thuman animal is useful for efficient production of proteins, especially of human animal is useful for efficient production of proteins, especially of thuman animal is useful material calls of the chimeric animal which myeloma cells to produce hybridomas capable of expressing the foreign gene (e.g. to produce the antibody)

The present invention describes a method of obtaining pluripotent cells containing foreign chromosomes or their fragments (preferably at least containing foreign chromosomes or their preparing cancerous cells containing the foreign chromosomes or fragments, then fusing these with pluripotent cells such as embryonic stem cells, embryonic reproductive cells embryonic cancer cells or their mutants. Also cascribed are: (1) a method of obtaining hybridoma cells (such as mouse A9 cells) with a high ability to produce hybridoma cells (such as mouse A9 cells) with a cell containing the foreign chromosomes or fragments (such as normal human diploid cells); (2) a method of utilising pluripotent cells or produce chimeric and transgenic non-human animals (especially mammals such as mice) which can express the foreign chromosomes or fragments introduced; and (3) chimeric animals, their offspring and tissues and cells derived from the offspring produced by a method as in (2). The introduced; and (3) chimeric animals, their offspring and tissues and cells are of human type and therefore not antigent in humans. They can also be used in the production of chimeric and serve as models for the study of human diseases. Adv52755 to A4V52828 are perve as models for the study of human diseases. Adv52755 to A4V52828 are

This sequence represents Basta-resistance gene (bar) PCR primer Bar 2, used with primer Bar 1 (AAZ12671) to determine whether the bar gene had been stably introduced into the genome of Basta-resistant plantlets. The plantlets had been previously been transformed with a superoxide plantlets had been previously been transformed with a superoxide of promoter (SOD) expression vector comprising a cucumber fruit dominant promoter (SOD), a cassava mSODI gene and the bar gene. SODs are ubiquicous enzymes which convert superoxide anion radicals to hydrogen peroxide anion radicals, and other reactive oxygen species such as hydrogen peroxide and hydroxyl radical, are generated by cranisms in response to environmental and biological stresses. SOD is thought to be effective in the treatment of arthritis, rheumatism, is chaemic heart disease and radiation damage, and has been used in commetics for the prevention of skin ageing? The transgenic plants (especially cucumber fruit) produced by the method of the invention are used as materials for cosmetics in medicines. The plants can be used as materials and a series of medicines. The plants can be used as

The present sequence represents a PCR primer for the human p51 gene, which is related to p53 and has cell proliferation regulation and tumour suppression activity. The p51 gene can be used in the investigation, diagnosis and treatment of diseases such as cancer, with which the p53 family cell proliferation regulation is associated. The p51 protein may be used for screening potential agonists and antagonists of its regulatory function, for use as drugs,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          se3 gene; mouse; liver development; signal transduction; liver disease;

PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAY36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antiense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, oppidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and veneral lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Vaccine, eye disease, conventional trachoma, nonendemic trachoma, paratrachoma, inclusion conjunctivitis, genital disease, perihepatitis, nongonococcal uretritis, epidymitis, cervicitis, salpingitis, PCR primer, bartholinitis, pneumopathy, venereal lymphogranulomatosis, ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                        This oligonuclectide is used as a reverse primer, together with a forward primer (see AAV64429), in quantitative PCR of the mouse ss3 gene. 10 demonstrate pairs (see AAV64427-46) were used in quantitative PCR to demonstrate elf (see AAV644113), sa3, and 145 (see AAV64414) expression in bloc and liver explant cultures, compared to HNF3-beta, C/EBP, alphafetorotein and glyceraldehyde 3-phosphate dehydrogenase. The invention provides early developing liver proteins and the genes coding for them (see AAV64410-24). These can be used in the treatment and diagnosis of liver diseases and other disorders, including those relating to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Vaccine, eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR primer; bartholinitis; pneumopathy; venereal lymphogranulomatosis; ss.
                                                                                                                                                                                                                                                              New isolated early liver development genes - used to develop products for treating, e.g. liver disease, hepatocellular carcinoma, degenerative neurological disorders, anaemia, ataxia or haemochromatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococoal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a primer/probe sequence of the invention. The primer and probe sequences are derived from the sequence of the human serine protease gene LKB1, and are used to detect variations in LKB1 leading to Peutz-Jeghers (PD) syndrome. The primers and probes can be used for the diagnosis, investigation and treatment of diseases in which variations in the LKB1 gene are implicated, such as PJ syndrome

A method has been developed of treating defective tissue comprising: (i) providing a number of hWT neurons and a neurologically defective mammal having a target trissue comprising defective cells, and (ii) transplanting the hWT neurons into the defective mammal so that the neurological defective for the mammal is ameliorated. Also described is a non-human mammal having transplanted hWT neurons. The method is especially used to treat thutington's disease or other neurological disorders. The method allows the transplantent of terminally differentiated neurons from call lines. The present sequence represents a PCR primer used in an example from the present invention for in vitro characterisation of hWT neurons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             - by

                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of nested primer NP2, which was used in the amplification of gene fragments obtained from a suppression subtractive hybridization reaction using LAPC xenograft cDNA and designed to identify novel prostate and prostate cancer-specific genes. A 437 bp clone was obtained. Pull-length cDNA (see AAZ94275) was subsequently cloned from a transcription factor that is normally expressed only in testis tissue, but is up-regulated in prostate and other types of cancer. The invention provides diagnostic and therapoutic methods useful in the management of various cancers which express PHELIX, including prostate cancer, bladder cancer, ovarian cancer and testicular cancer
                                                                                                                                                                                                                                                         Testis specific Helix Loop Helix proteins expressed in cancers and useful for the prevention, diagnosis and treatment of prostate, bladder and ovarian tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tumour necrosis factor receptor-associated factor; TRAP; human;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                               this sequence represents a PCR primer used to amplify a fragment of the human mitochondrial DNA. The PCR product is used to create a probe which is used in the Southern blot analysis of cells transfected with the recombinant plasmid of the invention. The plasmid is useful for the production of large-insert episomes in mammalian cell. The plasmid comprises a lymphotrophic herpes virus segment and a heterologous insert cepitation and a heterologous origin of plasmid replication and a heterologous origin of bacterial replication which is maintained as an episome in both bacterial and mammalian cells, cepicially B-lymphoblastoid cells (BLC), epithelial cells (BC) or a ceombinant plasmid is useful for transforming mammalian cells, specially B-lymphoblastoid cells (BLC), epithelial cells (BC) or a fusion of these, by transfecting a mammalian cell with the plasmid by lipofection. The recombinant plasmid is also useful for the production of large-insert episomes in mammalian cells. The invention also relates to a repetien barr virus nuclear antigen-1 (BBNA-1) gene having a partial IR3 domain deletion which is from 300-700 nucleotides in length. The BBNA-1 energy gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PHELIX; human; testis-specific; transcription factor; prostate cancer; bladder cancer; ovary cancer; testicular cancer; gene therapy; diagnosis; vaccine; PCR primer; ss.

The present invention relates to antisense oligonucleotides (see AAA55496 + A55757) which are targeted to nucleic acids encoding a human tumour necrosis factor receptor-associated factor (TRAP). The antisense sequences comprise at least one modified internucleotide linkage, which is a phosphorothhoate linkage. The oligonucleotides also include at least one modified sugar moiety come modified sugar moiety.

Sequences AAA55490-A55495 represent nucleotide sequences encoding human TRAF1-6. Included in the invention is a method for treating a human having a disease associated with the expression of TRAF comprising administering an antisense oligonucleotide. The reduction of jun kinase activation in cells comprises contacting the cells with an antisense oligonucleotide encoding the cells or tissues with an antisense oligonucleotide targeted to TRAF-6. Method for the reduction of E-selectin expression in cells or tissues comparises contacting the cells or tissues with an antisense oligonucleotide targeted to TRAF-6.
                                                                                                                                                                                                                                                                                                            The antisense oligonucleotides have antiproliferative and anti-
inflammatory activity and are useful for treating disorders associated
with cell proliferation and inflammation. The antisense oligonucleotides
may also be used as a diagnostic probe for studying gene function
diseases associated with TRAF expression such as inflammatory diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PTAN; testis specific; prostate cancer; overexpress; chromosome 1q22; diagnose; cancer; breast; vaccine; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       BPC-1 polypeptides and polymucleotides can be used for the detection of PBC-1 polypeptides and polymucleotides in biological samples, this is particularly useful for detecting cancers expressing BPC-1, e.g. prostate cancer or bladder cancer. Antibodies directed against BPC-1 or antisense
                        This sequence represents a PCR primer used in the isolation of cDNA fragments of the PTAN (testis specific protein expressed in prostate cancer) gene. FTAN is expressed in 3 isoforms PTAN-1, 2, and 3. The PTAN gene is located on chromosome 1022. PTAN is overexpressed in prostate cancer, and has a testis specific expression pattern in adult tissues. FTAN shows no homology to any known gene. PTAN can be used in methods for the diagnosis of cancer, especially prostate or breast cancer, where the normal tissue samples are prostate tissue, or breast tissue, bone tissue, lymphatic tissue, serum, blood, or urine. A vector containing the PTAN nucleotide sequence, a vaccine composition targeting PTAN, PTAN, ribozymes specific for PTAN mRNA and antisense sequences, capecially breast and prostate cancers. Cancer development can be inhibited by a vaccine composition targeting PTAN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated BPC-1 polypeptides, useful for developing products for the diagnosis, staging, prognosis and treatment of cancers, particularly prostate or bladder cancer.

polymucleotides can be used for treating such cancers. The BPC-1 collypeptides can also be used in vaccines for treating or inhibiting the development of a cancer expressing BPC-1. The polypeptides and collypeptides and produced can also be used for detection, prognosis, drug screening comprises a CUB domain which is expressed in prostate and bladder comprises a CUB domain which shows sequence similarity with CUB domains from carcinoma cells and which shows sequence similarity with CUB domains from other known proteins. In normal human tissues BPC-1 is only expressed in prostate cancer cells and bladder cancer cells. A number of synthetic oligonucleotides were used to generate BPC-1 cDNA from total cell RNA of tumour cells lines. These primers were a cDNA synthesis primer (AAZ93041), two adaptor sequences (AAZ93042-Z93045), a PCR primer (AAZ93046) and two nested primers (AAZ93047, AAZ93048). This sequence is one of the nested primers (NP)1 used in the amplification method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a method for obtaining a transgenic plant with male sterility. The method uses site specific recombination to stably transform the plant cells. The method involves the use of DNA encoding the histocyte lethal protein, linked to an auther specific promoter. The method is used to produce male sterile plants. Sequences AAA59949 to AAAS9961 are used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polynucleotide SEQ ID 13 used in method to culture sterile male plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of nested primer NP2, used in a secondary PCR amplification of gene fragments generated by a suppression subtractive hybridisation protocol that was designed to identify genes which may be differentially expressed in human prostate cancer. A partial clone, termed 22P4FI1 (see AA294894), was obtained and used to identify gene in normal tissues, and is also expressed in human prostate tumours, in some cases at high levels. The 22P4FI1 transcript and/or protein (see AA79489) may represent a useful diagnostic marker and/or protein (see target for prostate cancer. Methods of using 22P4FI1 polymicleotides, polypeptides and antibodies for the diagnosis and treatment of cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel testes-specific gene 22P4F11 which is expressed in human prostate cancer and is useful as a diagnostic marker and/or therapeutic target for prostate cancer.
                                                                                                                                                                                                                            22P4P11; human; testis; prostate cancer; diagnosis; gene therapy; marker; vaccine; PCR primer; ss.

PCR primers AAA14805-07 were used to amplify testis-specific protein Yencoded DNA. The specification describes a new method of diagnosis of prostate cancer. The method comprises determining the level of testis-specific protein Yencoded (TSPY) mRNA or protein, and comparing these TSPY mRNA or protein is indicative of prostate presence of elevated TSPY mRNA or protein is indicative of prostate cancer. Detection of TSPY mRNA expression or protein levels is useful in the diagnosis of prostate cancer. Antisense polymucleotides complementary to the coding sequence of human TSPY are useful for treating prostate cancer by inhibiting TSPY transcription (when contacted with the TSPY mRNA). Ribozymes are also useful for treating prostate cancer by cleaving the TSPY mRNA and therefore inhibiting its translation. The vaccine is useful for inhibiting the development of prostate cancer in a patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Foreign chromosome; microcell fusion; homologous recombination; antibody; targeting vector; transgenic animal; disease model; knockout animal; PCR primer; human; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Diagnosing prostate cancer by determining the level of testis-specific protein Y-encoded (TSPY) mRNA or protein and comparing these TSPY mRNA or protein levels to those of a normal tissue sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Primer 2 for human immunoglobulin gamma-1 constant region gene IGG1.

```
The invention relates to a novel method of producing cells containing a modified foreign chromosome or chromosome fragment. The method comprises:

(a) fusing a microcell comprising the foreign chromosome or chromosome fragment, with a cell having a high efficiency for homologous recombination; (b) marking the desired site of insertion of the foreign chromosome using a targeting vector; and (c) inducing deletion or transportation at the marked site. Transport animals produced by the method are useful to provide disease models and knockout animals, and in the production of human proteins, particularly human antibodies. This sequence is used in the method of the invention
                                                                                                                                                                                                                             Producing a cell containing modified foreign chromosomes, useful for the generation of transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Recombinant Corynebacterium DNA useful for production of pantothenic acid vitamin, comprises panB, panC or ilvD genes encoding enzymes.

Example 1; Page 6; 27pp; German.

This invention describes novel recombinant Corynebacterium DNA (I), present in microrganisms of the Corynebacterium genus and comprising at least one of the panB (ketopantohydroxymethyltransferase), panC (pantothenicacidsyntherase), especially the panBC operon, and/or ilvD (dihydroxyaciddehydratase) genes. (I) is useful for the preparation of pantothenic acid a vitamin which has applications including cosmetics, medicine and human and animal nutrition. The new preparation method using fermentation techniques produces the required stereo-isoform D form of pantothenic acid. This sequence represents a primer used in the isolation of the Corynebacterium glutamicum panBC operon which is described in the method of the invention

Novel putative transcription factor gene 36P1A6 for treatment, diagnosis and prevention of prostate, bladder, cervical, ovarian, pancreatic, and colonic cancer.

Example 1; Page 30; 53pp; English.

The human 36P1A6 gene encodes a putative transcription factor based on homology to the murine EHF gene which encodes a transcription factor which is a member of the ETS family. 36P1A6 is expressed in androgendeppendent and androgen-independent LAPC prostate cancer xenografts and in normal prostate at approximately equal levels. The highest expression is

in the prostate and colon. 36PlA6 may be involved in activating tumorpromoting genes or repressing genes that block tumorigenesis. The 36PlA6 polynucleotides and polynpeptides are used for the treatment and diagnosis of cancer, e.g. prostate, bladder, cervical, ovarian, pancreatic and colonic cancer (all claimed). Anti-16PlA6 antibodies may be used for burifying 38PlA6 and for isolating 38PlA6 homologues. Antisense oligonucleotides and ribosymes can be used to inhibit the transcription and translation of the 36PlA6 gene (claimed). The 36PlA6 polynucleotides and immunogenic fragments may also be used in cancer vaccines (claimed)

30P3CB polypeptide and polynucleotide used for diagnosing, treating and monitoring development of prostate cancer.

Example 1; Page 57; 99pp; English.

The present invention describes human prostate specific protein 30P3C8, which is over-expressed in prostate cancer cells. 30P3C8 has cytostatic cartivity and can be used in vaccines and gene therapy. Methods for detecting the levels of 30P3C8 protein or mRNA in prostate tissue, bone detecting the levels of 30P3C8 protein or mRNA in prostate tissue, bone tissue, lymphatic tissue, serum, blood or semen are used for diagnosing control proteins or cancers in an individual or disregulated cell growth e.g. hyperplasia. The cancers which are detected or diagnosed are of the bladder, pancreas, colon, brain, bone, lung, kidney or prostate by using cell protein, brain, bone, lung, kidney and prostate by using comparers, colon, brain, bone, lung, kidney and prostate of pancreas, colon, brain, bone, lung, kidney and prostate. 30P3C8 colon, brain, bone, lung, cancers expressing colon, brain, bone, lung, cancers. Anti-30P3C8 colon woncolonal antibodies bind to 30P3C8 and disrupt interactions between colons and metastasis and so anti-30P3C8 antibodies may disrupt the homing or and metastasis and so anti-30P3C8 antibodies may disrupt the homing or

New antisense compound for inhibiting the expression of signal transducer and activator of transcription 3 (STAT3) in cells or tissues and treating diseases or condition associated with STAT3, such as rheumatoid arthritis and cancer

Example 12; Page 63; 104pp; English.

The present invention describes an antisense compound (1), 8 to 30 ento-clookes in length, that is targeted to a nucleic acid molecule encoding STAT3 (Signal Transducer and Acrivator of Transcription) and which inhibits the expression of it. (1) has antinflammatory, antirheumatic, cytostatic and immunostimulatory activities. (1) is used for inhibiting the expression of STAT3 in cells or tissues, treating an animal having a disease or condition associated with STAT3 or a human having a disease or condition characterised by a reduction in apoptosis, and inducing apoptosis in a cell. Diseases or conditions that are treated are rheumatoid arthritis, cancer of the breast, prostate, brain, had and/or neck, leukaemia, myeloma, melanoma or lymphoma. (I) can also be used for diagnostic methods in detecting and determining the role of STAT3 in various cell functions, physiological processes and conditions and for diagnosing the conditions

```
ö
(I) can be used alone or with other drugs as an immunostimulator. (I) is used in sandwich and colourimetric assays, involving enzyme conjugation and radiolabeling and is used in diagnostic kits. AAC93150 encodes human STAT3 and AAC932131 encodes mouse STAT3 as given in the exemplification of the present invention. AAC93151 to AAC93230 and AAC93232 to AAC93239 represent STAT3 phosphorothioate antisense oligonucleotides, and AAC93300 represents a mismatch control oligonucleotide which are used in example
                                                                                                                                                                                                                                                                                                                                                                                                       modulation, signal transducer and activator of transcription;

New antisense compound for inhibiting the expression of signal transducer and activator of transcription 3 (STAT3) in cells or tissues and treating diseases or condition associated with STAT3, such as rheumatoid arthritis and cancer.

Example 12; Page 63; 104pp; English.

The present invention describes an antisense compound (I), 8 to 30 nucleobases in length, that is targeted to a nucleic acid molecule encoding STATA (Signal Transducer and Activator of Transcription) and which inhibits the expression of it. (I) has antiinflammatory, antirheumatic, cytostatic and immunostimulatory activities. (I) is used for inhibiting the expression of STAT3 in cells or tissues, treating an animal having a disease or condition associated with STAT3 or a human having a disease or condition characterised by a reduction in apoptosis, and inducing apoptosis in a cell. Diseases or conditions that are treated are rheumatoid arthritis, cancer of the breast, prostate, brain, head and/or neck, leukaemia, myeloma, melanoma or lymphoma. (I) can also be used for diagnostic methods in detecting and determining the role of STAT3 in various cell functions, physiological processes and conditions

```
and for diagnosing the conditions associated with expression of STAT3.

(I) can be used alone or with other drugs as an immunostimulator. (I) is used in sandwich and colourimetric assays, involving enzyme conjugation and radiolabeling and is used in diagnostic kits. AAC93150 encodes human STAT3 and AAC93231 encodes mouse STAT3 as given in the exemplification of represent invention. AAC93151 to AAC93230 and AAC93232 to AAC93239 encodes the present sharp hosphorochinate antisense oligonucleotides, and AAC93300 represents a mismatch control oligonucleotide which are used in example
                                                                                                                                                                                                                                                                                                                           3.1%;
                                                                                                                                                                                                                          from the present invention
                                                                                                                                                                                                                                                                                                                                                    Similarity
                                                                                                                                                                                                                                                                                                                         Query Match

New antisense compound for inhibiting the expression of signal transducer and activator of transcription 3 (STAT3) in cells or tissues and treating diseases or condition associated with STAT3, such as rheumatoid arthritis cancer and

Example 2; Page 47; 104pp; English

The present invention describes an antisense compound (I), 8 to 30 nucleobases in length, that is targeted to a nucleic acid molecule encoding STARIS (Signal Transducer and Activator of Transcription) and which inhibits the expression of it. (I) has antiinflammatory, antitheumatic, cytostatic and immunostimulatory activities. (I) is used for inhibiting the expression of STATIS in cells or tissues, treating an animal having a disease or condition associated with STATIS or a human having a disease or condition characterised by a reduction in apoptosis, and inducing apoptosis in a cell. Diseases or conditions that are treated are theuraction arthrities, cancer of the breast, prostate, brain, head and/or neck, lenkaemia, myeloma, melanoma or lymphoma. (I) can also be used for diagnostic methods in detecting and determining the role of

```
ô
and for diagnosing the conditions associated with expression of STRT3.

(I) can be used alone or with other drugs as an imminostimulator. (I) is used in sandwich and colourimetric assays, involving enzyme conjugation and radiolabeling and is used in diagnostic kits. AAC93150 encodes human STAT3 and AAC9321 encodes mouse STAT3 as given in the exemplification of the present invention. AAC93151 to AAC93330 and AAC93232 to AAC93239 represent STAT3 phosphorothinate antisense oligonuclectides, and AAC933300 represents a mismatch control oligonuclectide which are used in example

treated The present invention describes an antisense compound (1), 8 to 30 nucleobases in length, that is targeted to a nucleic acid molecule which inhibits the syzesion of it. (1) has antiinflammatory, antirheumatic, cytostatic and immunostimulatory activities. (1) is used for inhibiting the expression of STAT3 in cells or tissues, treating an animal having a disease or condition associated with STAT3 or a human having a disease or condition associated with STAT3 or a human having a disease or condition characterised by a reduction in apoptosis, and inducing apoptosis, in a cell. Diseases or conditions that are treated are theumatoid arthritis, cancer of the breast, prostate, brain, head and/or neck, leukaemia, myeloma, melanoma or lymphoma. (1) can also be

```
8$$$$$$$$$$$$$$$$$
```

```
used for diagnostic methods in detecting and determining the role of STAT3 in various cell functions, physiological processes and conditions and for diagnosing the conditions associated with expression of STAT3.

(I) can be used alone or with other drugs as an immunostimulator. (I) is used in sandwich and colourimetric assays, involving enzyme conjugation and radiolabeling and is used in diagnostic kits. AAC93150 encodes human STAT3 and AAC93231 encodes mouse STAT3 as given in the exemplification of the present invention. AAC93151 to AAC93230 and AAC93232 to AAC93239 represent STAT3 phosphorothicate antiense oligonucleotides, and AAC93300 represents a mismatch control oligonucleotide which are used in example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          from the present invention

Novel 24P4C12 polypeptides and polynucleotides, used in the diagnosis and treatment of cancer, especially prostate cancer.

Example 1; Page 65; 137pp; English.

The present invention describes a prostate tumour associated gene, designated 24P4C12, and its encoded protein. 24P4C12 has anticancer and cytostatic activity, and can be used in vaccine production and in gene therapy. A pharmaceutical composition or vaccine comprising 24P4C12 can be used to treat a patient with cancer, especially prostate cancer, the vaccine can also be used to inhibit the development or progression of cancer. The polypeptides and polynucleotides can be used to diagnose cancers, especially prostate cancer. A transgenic animal comprising 24P4C12 can be used for the development and screening of therapeutic reagents. The polypeptide is a transmembrane protein which is expressed specifically in prostate cancer, allowing the development of more specific anticancer therapies and diagnostic assays

The gene, which is found at chromosome 15q32-23, is upregulated in cancers such as that of the prostate, bladder, colon and pancreas. The sequences can be used to diagnose and treat these cancers, and to vaccinate against them. The present sequence is a PCR primer for the coding sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present invention relates to methods and compositions for the diagnosis and therapy of prostate cancer which utilise human SGP28 (Specific granule protein 28) gene and proteins. The method involves detecting cancers, particularly of prostate and colon, from coverexpression of SGP28 protein. The expression of SGP28, which is an extracted to the prostate and ovary, and is markedly up-regulated in prostate tumours. SGP28 sequence is used for diagnosis (including in vivo imaging), staging, monitoring and prognosis of prostatic and colon cancer, and for assisting selection of therapy. Also SGP28 expressing cancers can be treated by administering a composition or vaccine that contains a vector expressing an antibody specific for SGP28 protein, uncleic acid encoding SGP28 protein or its composition or vaccine that contains a vector expressing an antibody specific for SGP28 protein or therapeutic agent. SGP28 gene product of therapy contingers probed to toxin or therapeutic agent. SGP28 gene product of a also used as source of therapeutic antisense or ribozyme agents, polypeptides encoded by SGP28 gene and SGP28 agent product or is also used as source of therapeutic antisenses or ribozyme agents. SGP28 peptides and for isolating related sequences. SGP28 protein and its caraments are used to raise specific antibodies (Ab) and to identify specific binding agents (potentially useful as therapeutic and diagnostic agents) and also potential anticancer agents. The present sequence is a consetted primer 2 (NP2) used to amplify gene fragments resulting from SSH (suppression subtractive hybridisation) reaction. This sequence is used in the SSH isolation of cDNA fragment of human SGP28 gene

Human AKAP10 coding sequence PCR primer SEQ ID NO: 49.

CXXXXXXXX

```
Producing a database for identifying polymorphic genetic markers, comprises obtaining data relating to members of a healthy population and entering the information into a database.
                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides a database of human samples obtained from healthy individuals which can be used to identify polymorphic genetic markers. Data obtained for the database can be used to sort the samples by parameters such as age, sex and ethnicity. This is useful in linking markers with diseases, susceptibility to infection and drug responses. The present primer was used in an assay to demonstrate the uses of the database of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              y's disease;

The invention relates to isoform of human T-type low voltage activated calcium channel (alpha1G-c) cDNA and protein. Cells transformed with calcium channel DNA to express calcium alpha1G-c channel protein are used calcium channel DNA to express calcium alpha1G-c channel protein are used to identify specific modulators (antagonists or agonists). These condulators are useful as therapeutic agents and are used for treating wide range of calcium alpha1G-c channel-mediated disorders, e.g. stress conductive disorders, respiratory disorder, peripheral muscle disorder, chioringly disease, endocrine disorders, respiratory disorder, peripheral muscle disorder, conductive disorders involving regulation, potentiation of synaptic signals and cardiovascular disorders (e.g. atherosclerosis, cardiac hypertrophy, angina pectoris). Calcium alpha1G-c channel DNA is useful conditionally used as antisense sequences, in gene therapy. Calcium channel continually used as antisense sequences, in gene therapy. Calcium channel continually used as antisense sequences, in gene therapy. Calcium channel continually used as antisense sequences, in gene therapy. Calcium channel continually used as antisense sequences, in gene therapy. Calcium channel continually used as antisense sequences, in gene therapy. Calcium channel continually and passays. The present sequence is 18341P PCR primer used for generating calcium alpha1G-c probe which is used for screening human calcium alpha1G-c channel sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, 36P6D5 protein, secreted tumour antigen, therapy, cancer; kidney, bladder, ovary, breast, pancreas, colon, lung, vaccine, cytostatic, SSH; suppression subtractive hybridisation, PCR primer, 88.

The present invention relates to a gene and its encoded secreted tumour antigen, termed 36P6D5. These sequences are used for the diagnosis and treatment of various cancers which express 36P6D5, such as cancers of the kidney, bladder, ovary, breast, pancreas, colon and lungs. In normal individuals 36P6D5 protein, is predominantly expressed in pancreas, with comprising immunogenic protein of 36P6D5 is useful for inhibiting the comprising 36P6D5 protein of useful for inhibiting the comprising 36P6D5 protein is useful for diagnosis and/or progness of comprising 36P6D5 genes and/or translation of the 36P6D5 transcripts, and as therappeutic agents. The present sequence is a nested primer (NP)2 and as therappeutic agents. The present sequence is a nested primer (NP)2 used to amplify gene fragments resulting from SSH (suppression the SSH sublation of cDNA fragment of human 36P6D5 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; PC-LECTIN; C-type lectin; transmembrane antigen; normal testis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New PC-LECTIN polynuclectide encoding a transmembrane antigen over expressed in human prostate cancer, useful for the prognosis, diagnosis and treatment of prostate cancer.
                                           Detecting presence of cancer expressing 36P6D5 protein in individual by comparing protein level in test sample to normal sample, where elevated level of protein in test sample indicates presence of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PCR primer NP2, SEQ ID NO:18, used in human PC-LECTIN cDNA isolation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

contigen, PC-LECTIN (AAB73309) and cDNA encoding it (AAF76004). The expression of the human PC-LECTIN gene is normally restricted to the expression of the human PC-LECTIN gene is normally restricted to the captures of higher in androgen-dependent prostate tumours compared with androgen-independent prostate tumours, and expression is therefore likely cobe dependent on the presence of androgen. Human PC-LECTIN therefore represents a diagnostic and therapeutic target for prostate cancer. Fundancer, correspondent prostate cancer. Human PC-LECTIN exhibits compared to be the human crthologue of layilin, as diverges significantly in a key functional domain proposed for the layilin complexity by the hamman PC-LECTIN or immunogenic portion thereof, a vector protein. Human PC-LECTIN or immunogenic portion thereof, a vector coloning PC-LECTIN or immunogenic portion thereof, a vector coloning PC-LECTIN or immunogenic portion thereof, a vector coloning PC-LECTIN antibodent prostate cancer, but also breast, bladder, lung, bone, particularly prostate cancer, but also breast, bladder, lung, bone, colon, pancreatic, testicular, certical or ovarian cancers that express prostate cancer and other PC-LECTIN expressing cancers. PC-LECTIN proteins are also useful for diagnosing the presence colon, pancreatic, testicular, certical and orlectiones are useful in the transmit (e.g., antisense therapy), diagnosis and/or prognosis of cancer and other PC-LECTIN expressing cancers. PC-LECTIN conclosing and proteins may additionally be used in drug discovery to identify molecules that modulate PC-LECTIN function or expression. The present sequence represents a PCR primer used in the isolation of human property and property of program of the program
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PC-LECTIN CDNA

Chimeric gene encoding bipartite trehalose synthesis enzyme, useful for producing transgenic plants with increased trehalose content.

Disclosure; Page 16; 59pp; English

The present invention relates to a chimeric gene comprising a potato patatin promoter and proteinase inhibitor II terminator (Potrbil), encoding bipartite trehalose synthesising enzyme and method for production of trehalose synthesising enzyme and method for production of trehalose and increasing the level of trehalose cremulation in transgenic plants by inhibiting the degradation of trehalose by trehalose by trehalose phosphate phosphatese (TPS) and trehalose phosphate phosphatese (TPS) and trehalose phosphate phosphatese (TPP) activities, enhances the production of trehalose as it enhalose (TPP) activities, entance to pathway from UPP-glucose and glucose-6-phosphate into trehalose at one and the same site. Plants that contain chimeric gene have improved at one and the same site. Plants that contain chimeric gene have improved at one and the same site. Plants that contain chimeric gene have improved and shelf-life. Trehalose is used for forced water extraction, e.g. in (freeze) drying, particularly where applied to foods, resulting in retention of natural flavours and nutritional value and allowing rapid reconstitution, also as e.g. a stabiliser for vaccines, enzymes, membranes and nucleic acids and it forms a stable, chemically inert construction of pMOG845 plasmid

Novel gene designated PHOR-1, a G-protein-coupled receptor up-regulated in prostate cancer, useful as diagnostic marker and therapeutic target for cancers of prostate, kidney, uterus.

Example 1; Page 59; 139pp; English.

The invention relates to a novel G-protein-coupled receptor up-regulated in prostate cancer, termed PHOR-1. The encoding cDNA is contained in plasmid designated pl01P3A11 deposited with ATCC as Accession No.PTA-312. PHOR-1 polypeptides and polymucleotides are useful for diagnosing the presence of cancer, especially prostate, kidney, uterine, cervical,

stomach or rectal cancer by determining and comparing the level of the protein or mRNA expression in teet and normal tissue samples. Pharmaceutical compositions comprising PHOR-1 is useful for treating cancer. PHOR-1 proteins are useful for identifying ligands and other agents and cellular constituents that binds to PHOR-1 gene product and for generating antibodies which are useful in diagnostic, prognostic and imaging methodologies and for the treatment of prostate cancer. Cell innes expressing PHOR-1 are useful for identifying protein-protein interactions mediated by PHOR-1. The present sequence represents a primer used in isolation of the PHOR-1 (prostate homologue of olfactory receptor

                                                                                                                                                                                                                                 The invention is directed to antisense compounds, particularly oligonucleotides which are targetted to a DNA encoding protein phosphatase 18 (PTP1B) to modulate its expression. The antisense compounds are useful for diagnosis, prophylaxis and treatment of diseases associated with the expression of PTP1B, to prevent or delay infection, inflammation and tumour formation and as a research reagent. The PTP1B DNA is useful in gene therapy. The present sequence is an antisense oligonucleotide with a phosphorchioate backbone. This oligo is targetted to human PTP1B to inhibit its expression
                                                                                    New antisense compounds capable of modulating expression of human protein phosphatase 1B, useful for diagnosis, prophylaxis and treatment of diseases associated with expression of protein phosphatase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Rat; PTP1B; protein phosphatase 1B inhibitor; antisense; gene therapy; infection; inflammation; tumour; prophylaxis; phosphorothioate; ss.

The invention is directed to antisense compounds, particularly oligonuclectides which are targetted to a DNA encoding protein phosphatase 1B (PPTB) to modulate its expression. The antisense expension are useful for diagnosis, prophylaxis and treatment of diseases associated with the expression of PTPIB, to prevent or delay infection, inflammation and tumour formation and as a research reagent. The PTPIB DNA is useful in gene therapy. The present sequence is an antisense oligonuclectide with a phosphorchicate backbone. This oligo is targetted to rat PTPIB to inhibit its expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Zebrafish; morphogenic signal; neuron; hedgehog gene; embryonic patterning; cell culture; cell differentiation; ischaemia; cell proliferative disorder; intracerebral grafting; Huntington's chorea;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    · ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention is directed to antisense compounds, particularly oligomucleotides which are targetted to a DNA encoding protein phosphatase 1B (PTP1B) to modulate its expression. The antisense compounds are useful for diagnosis, prophylaxis and treatment of diseases associated with the expression of PTP1B, to prevent or delay infection, inflammation and tumour formation and as a research reagent. The PTP1B DNA is useful in gene therapy. The present sequence is an antisense oligomucleotide with a phosphorothicate backbone. This oligo is targetted to rat PTP1B to inhibit its expression
                                                                                                                                                                                                                                                                                                                                                         New antisense compounds capable of modulating expression of human protein phosphatase 1B, useful for diagnosis, prophylaxis and treatment of diseases associated with expression of protein phosphatase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Rat, PTP1B; protein phosphatase 1B inhibitor; antisense; gene therapy; infection; inflammation; tumour; prophylaxis; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to assay for screening compounds that potentiate or inhibit binding of hedgehog polypeptide to naturally occurring patched receptor. The hedgehog proteans comprise morphogenic signals produced by embryonic patterning centres, and are involved in the formation and maintenance of ordered spatial arrangements of formation and maintenance of ordered spatial arrangements of different discussions in the proteins can be used to generate and/or maintain an array of different vertebrate tissues both in vitro and in vivo. The invention also relates to a method for modulating growth, differentiation or survival of a mammalian cell (e.g. neuron, testicular cell) responsive to hedgehog agonists and antagonists can be used in cell culture techniques to enhance survival and maintenance of neurons and various vertebrate organogenic pathways. The hedgehog gene is useful in determining whether a patient is at the risk of disorder characterised by commend cell prolliferation or aberrant control of differentiation. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                hedgehog proteins or mimetics can be used to induce foetal neurons especially neuronal stem cells in intracerebral grafting. The protein or its mimetic can be used in the treatment of neurological conditions e.g. injury to nervous system, ischaemia resulting from stroke, Alzheimer's disease, Parkinson's disease, Huntington's chorea, amyotrophic lateral sclerosis (ALS) and multiple sclerosis. The present sequence is a degenerate PCR primer used to amplify Zebrafish hedgehog gene. (Updated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention is related to the coding sequence and protein fragments of a human catenin-binding zinc finger protein. The coding sequence was isolated from a human kidney cDNA library, but is expressed in most human tissue. The sequences provided by the invention can be used in the diagnosis and treatment of cancer and neurological disorders, and in drug screening to identify compounds capable of the same
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid or its fragments, useful for diagnosing and treating cancer and neurological disorders, corresponds to a catenin-binding protein in signal transduction and gene regulatory pathways.

The nucleic acid sequences represent the 83P5G4 gene and the primers and adaptors used to amplify 83P5G4 DNA. 83P5G4 exhibits prostate specific expression in normal adult tissue, but it is also aberrantly expressed in many cancers including tumours of the prostate, testis, bladder, kidney, brain, bone, cervix, uterus, ovary, breast, pancreas, stomach, rectum, clon and lung. The 83P5G4 polymuleoide, its related protein and also peptide fragments of the protein are therefore useful for diagnosing and treating cancer. A vector comprising a polymucleotide which encodes a single chain monoclonal antibody, that immunospecifically binds to an single chain monoclonal antibody, that immunospecifically binds to an paying the 83P5G4 related protein, and a ribozyme capable of cleaving a polymucleotide having the 83P5G4 coding sequence, are both useful in the present of a composition for treating a patient with a cancer that expresses 83P5G4. The sequences can be used in diagnostic methods to monitor the level of 83P5G4 gene products in serum, blood, usine and cut issue and to thereby detect the presence of cancerous cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           An isolated 83P5G4-related protein useful as a diagnostic and/or therapeutic agent in multiple cancers such as prostate, bladder and bone

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to nucleic acids encoding hedgehog proteins selected from sonic hedgehog (Shh), indian hedgehog (Ihh), desert hedgehog (Dhh) polypepides. The hedgehog genes are involved in the formation of ordered spatial arrangements of differentiated tissue in vertebrates. The nucleic acid sequences are useful for producing hedgehog proteins, used for promoting differentiation of, or survival of differentiation of neuronal cells, and for promoting proliferation, survival or differentiation of mesenchymal, endodermal or ectodermal tissue, particularly chondrocytes, or testicular germ line cells. Sequences AAH76125-126 represent PCR primers for amplifying a zebrafish Shh genomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel nucleic acid encoding a hedgehog polypeptide, used to produce the polypeptide, which is used to promote proliferation, survival, and/or differentiation of neuronal and mesodermal tissue.

The invention is directed to antisense compounds, particularly oligonucleotides which are targetted to a DNA encoding human protein kinase A (FXA) catalytic subunit C-alpha to modulate (inhibit) its expression. The antisense compounds are useful for diagnostics, therapeutics, prophylaxis and as research reagents or kits. The antisense oligonucleotides are useful for treating human, suspected of having or being prone to a disease or condition associated with the expression of PKA catalytic subunit C-alpha. In particular, the antisense oligonucleotides are useful for preventing, delaying or treating infection, inflammation and tumour formation. They are also useful in antisense therapy. The present sequence is a chimeric antisense oligonucleotide with a phosphorothioate backbone. This oligo is targetted to the cooling region of human PKA catalytic subunit C-alpha to inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Human PKA C-alpha chimeric antisense oligonucleotide (ISIS# 102684).

(first entry)

10-SEP-2001

AAD09658;

658/c AAD09658 standard; DNA; 20 BP.

RESULT 348

AAD09658

Human; protein kinase A; PKA catalytic subunit C-alpha inhibitor; therapy; infection; inflammation; tumour; prophylaxis; antisense; phosphorothioate backbone; chimeric; ss.

Location/Qualifiers

Key

Homo sapiens. Synthetic. Chimeric.

RESULT 349

systemic lupus erythematosus; allograft rejection; ISIS 107231; ss

                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human catenin-binding proteins and their corresponding cDNA molecules which functions in signal transduction and gene regulatory pathways. The invention also provides an isolated and/or recombinant nucleic acid or its functional fragment, homologue or derivative, corresponding to a alpha-catenin binding protein. The invention also relates to a novel human zinc finger protein binding with a member of the a-catulin/vinculin family, preferably with a human isoform of alpha N-catenin (neural form). The invention also relates to the field of drug discovery, diagnosis, prognosis and treatment of cancer and neurological disorders. The present sequence is a PCR primer which is used for amplifying human ANC_2HOI CDNA
                                                                                                                                                                                                                                                                                                                                            Novel recombinant nucleic acids useful for diagnosing, prognosing and/or
                                                                                                                                                                                                                                                                                                                                                        treating cancer and neurological disorders, corresponds to a protein binding to alpha-catenin protein and with signal transduction function.
                                                                                                      Human; ANC_2H01 protein; catenin-binding protein; signal transduction; gene regulation; thos finger protein; alphaN-catenin; drug screening; therapy; cancer; neurological disorder; cytostatic; neuroprotective; PCR primer; RACE; rapid amplification of cDNA end; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                  Human ANC_2H01 cDNA amplifying reverse 5' RACE PCR primer, FVR359R.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Integrin alpha 4; antisense; very late antigen 4; VLA4; utchind disease; inflammatory disease; rheumatoid arthritis; multiple sclerosis; tumour metastasis; melanoma; asthma; psoriasis; allergy; Grave's disease; Hashimoto's thyroiditis; oligonucleotide;

The sequence is an antisense oligonucleotide targetting human integrin 4, a protein involved in autoimmune and inflammatory diseases. The invention relates to antisense inhibitors of integrin alpha 4 which target and inhibit expression of integrin alpha 4. The antisense molecules are useful for inhibiting the expression of integrin alpha 4 in human cells or tissues, treating an animal having a disease or condition associated with autoimmune disease or condition, autoimmune disease or condition; autoimmune disease or condition including rheumatoid arthritis, multiple sclerosis and tumour metastases, melanoma, asthma, psoriasis, allergy, care's disease, Hashimoto's thyroiditis, systemic lugus erythematosus and allograft rejection, and diseases or conditions characterised by leukocyte migration into affected tissues, preferably central nervous system tissues. The antisense molecules are also useful for reducing the levels of VLA-4 and alpha4beta7 integrin in human cells or tissues, and reducing the adherence of cells of a first type e.g., melanoma cells or illicities in the adherence of cells of a first type e.g., melanoma cells or illicities of a second type e.g., melanoma calls or illicities of a second type e.g., melanoma calls or illicities of a first type e.g., melanoma calls or illicities of a first type e.g., melanoma calls or illicities of a first type e.g., melanoma calls or illicities of a first type e.g., melanoma calls or illicities of a first type e.g., melanoma calls or illicities of a first type e.g., melanoma calls or illicities of a first type e.g., melanoma calls or illicities of a first type e.g., melanoma calls or illicities of a first type e.g., melanoma calls or illicities of a first type e.g., melanoma calls or illicities of a first type e.g., melanoma calls or illicities of a first type e.g., melanoma calls or illicities of a first type e.g., melanoma calls or illicities of a first type e.g., melanoma calls or illicities characteria of e.g., melanoma calls or illicities characteria or illic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ô

New polynucleotide for treating and diagnosing prostate cancer is the 103P2D6 gene which encodes for 103P2D6-related proteins.

Example 1; Page 55; 132pp; English.

Sequences AAS41293-AAS42208 represent the 103P2D6 gene and the primers and adaptors used to amplify 103P2D6 DNA. 103P2D6 is not expressed in normal adult tissue but is aberrantly expressed in some foreal tissues on and many cancers including tumours of the prostate, testis, bladder, bone, cervix, ovary, breast, pancreas, colon and lung. The 103P2D6 polymucleotide, its related protein and also peptide fragments of the protein are therefore useful for diagnosing and treating cancer. A vector comprising a polymucleotide which encodes a single chain monoclonal antibody, that immunospecifically binds to an 103P2D6 related protein, and a ribozyme capable of cleaving a polymucleotide having the 103P2D6 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 103P2D6. The sequences can be used in diagnostic methods to monitor the level of 103P2D6 gene products in serum, blood, urine and tissue and to thereby detect the presence of cancerous cells

Nucleic acid encoding delta-6-desaturase gene useful for treating atopic eczema, mastalgia, rheumatoid arthritis, Sjogren's syndrome, gastrointestinal disorders, viral infections and post viral fatigue.

Example 4; Page 69; 164pp; English.

The invention relates to polynuclectides that control delta-6 desaturase genes (D6D) and methods useful for identifying compounds which inhibit or promote the activity of mammalian D6D. Compounds which modulate D6D gene promote the activity of mammalian D6D. Compounds which modulate D6D gene casema, mastalgia, rheumatoid arthritis, Sjogren's syndrome, atopic casema, mastalgia, rheumatoid arthritis, Sjogren's syndrome, endometriosis, vixal infections and post vixal fatigue, premerstrual syndrome, candiovascular disease, Crohn's disease, cancer, Alzheimer's syndrome, cardiovascular disease, Crohn's disease, cancer, compenital liver disease, schizophrenia, diabetes and diabetic compenital invertion are also useful for inhibiting progressive and acute disorders such as arterial hypertension, atherosodierosals, dironic acute disorders and autoimmune disorders, hypertoolesterolaemia and other accopic disorders. D6D genes are useful in gene therapy. The present acquence is a PCR primer used to amplify human delta-6-desaturase (hD6D-

Raitano AB, Saffran DC, Mitchell SC;

The present sequence is nested primer (NP2) which is used to isolate the human six transmembrane epithelial antigen of the prostate (STEAP) cDNA fragment generated from suppression subtractive hybridisation (SSH3).

STEAP is a member of cell surface serpentine transmembrane antigens.

STEAP gene is used in gene therapy. Inhibiting the development or progression of a cancer (eg. prostate, colon, bladder, lung, ovarian and parceatic) expressing STEAP or inhibiting growth or killing cells expressing STEAP, or inhibiting the prostating a vaccine composition to the patient. Treating a patient with a cancer that expresses STEAP, or inhibiting growth or killing cells expressing STEAP, or inhibiting growth or killing cells expressing sight chains of the monoclonal antibody that comprises the variable domains of the heavy and light chains of the monoclonal antibody that specifically binds to STEAP, such that the vector delivers the single chain monoclonal antibody coding sequence to the cancer cells and the encoded single chain monoclonal antibody is expressed intracellularly New STEAP (six transmembrane epithelial antigen of the prostate) proteins, expressed in human cancers, useful for detecting and treating Example 1; Page 70; 187pp; English.

Prostate and testis-related gene 84P2A9 cDNA nested primer #2. 24-OCT-2001 (first entry)

84P2A9; PCR primer; DNA adaptor; prostate; testis; tissue; cancer; 88; leukaemia; tumour; kidney; brain; bone; skin; ovary; breast; pancreas; colon; lung; cytostatic; gene therapy; antibody therapy; ribozyme; single chain monoclonal antibody; serum; blood; urine.

```
The mucleic acid sequences represent the 84P2A9 gene and the primers and adaptors used to amplify 84P2A9 DNA. 84P2A9 exhibits prostate and testis specific expression in normal adult tissue, but it is also aberrantly expressed in many cancers including leukaemia and tumnours of the prostate, testis, kidney, brain, bone, skin, ovary, breast, pancreas, colon and lung. The 84P2A9 polymucleotide, its related protein and also peptide fragments of the protein are therefore useful for diagnosing and treating cancer. A vector comprising a polymucleotide which encodes a single chain monoclonal antibody, that immunospecifically binds to an 84P2A9-related protein, and a ribozyme capable of cleaving a polymucleotide having the 84P2A9 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 84P2A9. The sequences can be used in diagnostic methods to monitor the level of 84P2A9 gene products in serum, blood, urine and tissue and to thereby detect the presence of cancerous cells
                                                                                                                                                                                                                                                                                                                                              New 84P2A9 gene and its encoded protein, useful for diagnosing and treating cancer, e.g. leukemia and cancer of the prostate, testis, kidney, brain or bone, or for eliciting an immune response.
                                                                                                                                                                                                                                            Levin E, Mitchell SC;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 20 BP; 3 A; 5 C; 10 G; 2 T; 0 U; 0 Other;

The present invention describes a method for monitoring 158P1H4 gene products in a biological sample from a patient who has or is suspected of paving cancer. The method comprises determining the status of 158P1H4 gene products in a tissue sample from an individual, comparing the status of the presence of aberrant 158P1H4 gene products in a normal sample, and can the status of 158P1H4 gene products in a normal sample, and contained the presence of aberrant 158P1H4 gene products in the sample. 158P1H4 sequences have cytostatic activity and can be used in vaccine production. 158P1H4 polynucleotides may be used in monitoring genetic abnormalities. The 158P1H4 proteins may be used in monitoring genetic containing the malignant phenotype, in generating and characterising containing the malignant phenotype, in generating and characterising containing the products in normal versus cancerous tissues and so elucidating the malignant phenotype, in generating and characterising cancer vaccines. Antibodies against 158P1H4 are useful in diagnostic and cytotoxic T lymphocyte (CTL) or helper T lymphocyte (HTL) responses, and simmunological reagents for detecting 158P1H4 expressing cells. The as immunological reagents for detecting 158P1H4 expressing cells. The prognostic assays, and imaging methodologies. The 158P1H4 gene has been contended to chromosome 8q22-q23, and the 158P1H4 gene also described in the present invention as represent sequences used in the exemplification of the present invention Example 45; Page 116; 209pp; English.

Monitoring 158P1H4 gene products in biological sample from patient who has or is suspected of having cancer, useful for treating cancer, comprises identifying presence of aberrant 158P1H4 gene products in biological sample.

Example 1; Page 69; 209pp; English.

The present invention describes a method for monitoring 158P1H4 gene products in a biological sample from a patient who has or is suspected of having cancer. The method comprises determining the status of 158P1H4 gene products in a tissue sample from an individual, comparing the status of 158P1H4 gene products in a normal sample, and controlled to the status of 158P1H4 gene products in a normal sample, and controlled to the status of 158P1H4 polynucleotides may be used in wonitoring genetic production. 158P1H4 polynucleotides may be used in monitoring genetic abnormalities. The 158P1H4 proteins may be used in monitoring genetic abnormalities. The 158P1H4 proteins may be used in monitoring genetic controlled in ormal versus cancerous tissues and so elucidating the malignant phenotype, in generating and characterising concerting the malignant phenotype, in generating and characterising concerting that bind to 158P1H4 or its particular domain, and for generating cancer vaccines. Antibodies against 158P1H4 are useful in diagnostic and cytotoxic Tlymphocyte (CTL) or helper Tlymphocyte (HTL) responses, and inmaging methodologies. The antibodies are particularly useful in bladder cancer diagnostic and prognostic assays, and imaging methodologies. The also described in correct to chromosome 8922-923, and the 158P1H4 gene also described in the present invention has been located to chromosome 8922-923, and the 158P1H4 gene also described in the present invention has been located to chromosome 8922-923, and the orenomosome 8923. Ablished to chromosome 8922-923, and the 158P1H4 gene also described in the exemplification of the present invention

The invention relates to antisense compounds targeted to a nucleic acid molecule encoding a signal transducer and activator of transcription (STAT) protein, specifically STAT3, where the antisense compounds inhibit the expression of STAT3. The antisense squences are useful for inhibiting the expression of STAT3 in cells or tissues, inducing Fas-mediated approasis in cells, and sensitising cells to apoptosis. They are also useful for treating an animal having a disease or condition associated with STAT3. These disorders include inflammatory or autoimmune breast, prostate, brain and head and neck and leukaemias, myelomas, melanomas and lymphomas. Also treatable are human diseases or conditions characterised by a reduction in apoptosis or an insensitivity to apoptotic signals. The sequences of the invention can be used in clinical research, for detecting and determining the role of STAT3 in various cell functions and physiological processes and for diagnosing conditions canced with the expression of STAT3. The sequences represent cDNA encoding human STAT3 and human STAT3 oligonucleotides Sequence 20 BP; 2 A; 6 C; 8 G; 4 T; 0 U; 0 Other;

Prognosis and diagnosis of muscular steatosis, useful e.g. for selecting animals for breeding, by measuring levels of specific markers, also treating or inducing steatosis.

Example 1; Page 39; 190pp; English.

The invention relates to prognosis or diagnosis of muscular steatosis by measuring the level of a muscular steatosis modulating feator (MSMF) in a human or animal and comparing this with the level in a healthy control. Any difference indicates presence of, or predisposition to, muscular steatosis. The method is particularly used for diagnosis or prognosis of counders in animal breeding. Also (ant) agonists of MSMF can be used to treat, or induce (for increasing the fat content of food) muscular steatosis, in humans and animals. The MSMF markers are also useful in the study of diseases and conditions such as obesity, hyperlipidaemia, archeroscierosis, wound healing, tumours and amyotrophic lateral sclerosis invention from its gene

Novel isolated 55P4H4-related protein encoded by a gene over-expressed in multiple cancers, useful as a diagnostic and/or therapeutic agent for cancer, preferably prostate cancer.

Example 1; Page 54; 160pp; English.

This invention relates to an isolated 55P4H4-related protein encoded by a gene that is over-expressed in multiple cancers. The polypeptide is useful for inducing an immune response to an 55P4H4 protein, providing the protein comprises of at least one T cell or B cell epitope. The immune system cell is a B cell which generates antibodies that specifically bind to the protein or is a T cell, preferably a cytotoxic T

cell (CTC) which kills an autologous cell that expresses the 55P4H4
protein, or a helper T cell (HTL) which secretes cytokines that
callitate the cytotoxic activity of a cytotoxic T lymphocyte. A method
is mentioned which is considered useful for monitoring the presence of
cancer in an individual, where the presence of elevated 55P4H4 mRNA or
protein expression in the test sample relative to the normal tissue
sample provides an indication of the presence or status of cancer which
course in a prostate, kidney, testis, lung, cervix, bone, bladder, brain
ocurse in a prostate, kidney, testis, lung, cervix, bone, bladder, brain
conditions associated with disregulated cell growth such as cancer and is
also useful in forenaic analysis of tissues of unknown origin, to treat a
pathological condition characterized by the overaxpression of 55P4H4, for
assessing the status of 55P4H4 gene products in normal versus cancerous
tissue, and to assess the presence of perturbations in specific regions
of the 55P4H4 gene. This sequence represents nested primer (NP) 2 used
during the method highlighted in the examples

Novel purified and isolated glycoprotein designated ENDO-1, useful as marker for diagnosing endometriosis in female patient suspected of having endometriosis,

Example 7; Page 10; 20pp; English.

PCR primers ABL41837-38 were used to amplify a cDNA fragment of rat endometrictic protein ENDO-1. ENDO-1 is a N-acetyl linked glycoprotein, synthesized and secreted specifically by stromal cells of endometrictic tissue origin. Human ENDO-1 has a molecular weight of 40000-55000 as determined by two-dimensional sodium dodecyl sulphate-polyacrylamide gelectrophoresis (SDS-PAGE), and has an isoelectric point of 4.0-5.5. ENDO-1 is useful as a marker for diagnosing endometriosis in a female patient suspected of having endometriosis. Endometriosis in a female patient be diagnosed by obtaining a sample from the patient, and detecting the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a compound of 8-50 nucleobases in length
targeted to a nucleic acid encoding protein phosphatase 1B (PTP1B), where
the compound specifically hybridises with and inhibits the expression of
PTP1B (e.g. an antieense oligonucleotide). Also included are (1) a
COMPOUND of an active site on a nucleic acid encoding
COMPOUND of an active site on a nucleic acid encoding
COMPOUND of an active site on a nucleic acid encoding
COMPOUND of an active site on a nucleic acid encoding
COMPOUND or suspected of Paying alsease or condition associated
COMPOUND or suspected of having a disease or condition associated
COMPOUND or an animal comprising administering the compound; (5)
COMPOUND or active site of a disease or condition associated
COMPOUND or active site of a nuclease or condition associated
COMPOUND or active site of a nuclease or condition associated
COMPOUND or active or active site of a nuclease or condition associated
COMPOUND or active site of a nuclease or condition associated
COMPOUND or active site of a disease or condition associated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (MCKA/)
                                                                                                                                                                                                                                                                                                                  RESULT 364
```

```
The invention relates to a compound of 8-50 nucleobases in length targeted to a nucleic acid encoding protein phosphatase 1B (FTP1B), where the compound specifically hybridises with and inhibits the expression of PTP1B (e.g. an antisense oligonucleotide). Also included are (1) a compound of 8-50 nucleobase oligonucleotide). Also included are (1) an 8 nucleobase portion of an active site on a nucleic acid encoding PTP1B; (2) inhibiting the expression of FTP1B in cells or tissues comprising contacting the cells or tissues with the compound; treating an animal having or suspected of having a disease or condition associated with PTP1B comprising administering the compound; (4) decreasing blood
                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Compound for inhibiting the expression of protein phosphatase 1B (PTP1B) and for treating diabetes, cancer, or obesity, comprises an antisense oligonucleotide targeted to nucleic acid encoding PTP1B.
pTPIB, such as type 2 diabetes, obesity, cancer (especially ovarian cancer, chronic myeloid leukaemia and hyperproliferative diseases in an animal having or suspected of having the disease or condition, and decreasing blood sugar levels or preventing or delaying the onset of an increase in blood glucose levels in an animal. The compound is also used in diagnoserics, therapeutics, prophylaxis, and in research reagents and kits. The present sequence is an antisense compound of the invention targetting rat PTPIB
                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense, protein phosphatase 1B; PTP1B; ss; probe; rat; type 2 diabetes; obesity; ovarian cancer; chronic myeloid leukaemia; hyperproliferative disease; antidiabetic; anorectic; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                ..

cengar levels in an animal comprising administering the compound; (5)
preventing or delaying the onset of a disease or condition associated
with PPPID in an animal comprising administering the compound; and (6)
preventing or delaying the onset of an increase in blood glucose levels
in an animal comprising administering the compound. The compound is used
to inhibit the expression of PPPIB in cells or tissues, to treat or
prevent or delay the onset of a disease or condition associated with
PPPIB, such as type 2 diabetes, obesity, cancer (especially ovarian
cancer, chronic myeloid leukaemia and hyperprofiferative diseases in an
mimal having or suspected of having the disease or condition, and for
decreasing blood sugar levels or preventing or delaying the onset of an
increase in blood glucose levels in an animal. The compound is also used
in diagnostics, therapeutics, prophylaxis, and in research reagents and
kits. The present sequence is an antisense compound of the invention

Compound for inhibiting the expression of protein phosphatase 1B (PTP1B) and for treating diabetes, cancer, or obesity, comprises an antisense oligonucleotide targeted to nucleic acid encoding PTP1B.

Example 15; Page 23; 133pp; English.

The invention relates to a compound of 8-50 nucleobases in length targeted to a nucleic acid encoding protein phosphatase 1B (PTP1B), where the compound specifically hybridises with and inhibits the expression of

CC compound of 8-50 nucleobases in length which specifically hybridises with an 8 nucleobase portion of an active site on a nucleic acid encoding property (2) inhibiting the expression of PTP1B in cells or tissues comprising contacting the captesion of PTP1B in cells or tissues comprising contacting the calls or tissues with the compound; treating an animal having or suspected of having a disease or condition associated with PTP1B comprising administering the compound; (4) decreasing blood sugar levels in an animal comprising administering the compound; (5) preventing or delaying the onset of a disease or condition associated with PTP1B in animal comprising administering the compound; and (6) preventing or delaying the onset of an increase in blood glucose levels in an animal comprising administering the compound; The compound is used to inhibit the expression of PTP1B in cells or tissues, to treat or prevent or delay the onset of a disease or condition associated with PTP1B, such as type 2 diabetes, obesity, cancer (especially ovarian cancer; chronic myeloid leukaemia and hyperproliferative diseases in an animal having or suspected of having the disease or condition, and for decreasing blood sugar levels or preventing or delaying the onset of an increase in blood glucose levels in an animal. The compound is also used in diagnostics, therapeutics, prophylaxis, and in research reagents and kits. The present sequence is an antisense compound of the invention cut argetting human PTPIB

New gene designated 34P3D7, encoding a tissue-specific protein highly expressed in prostate cancer, for use as diagnostic and/or therapeutic target for cancers, and for eliciting an immune response.

Example 1; Page 53; 112pp; English.

The invention relates to a polynucleotide, designated 34P3D7, encoding 34P3D7-related protein, comprising a sequence of 2198 nucleotides fully

defined in the specification. The presence of elevated 3493D7 mRNA or protein expression indicates the presence of cancer occurring in brostate, bladder, kidney, brain, bone, cervical, uterine, ovarian, breast, pancreatic, stomach, colon, rectal leukcoytes, liver, and lung tissue, and in melanocytes. An antibody against the 3493D7-related polynucleotide, or a ribozyme capable of cleaving the 3493D7 polynucleotide, or a ribozyme capable of cleaving the 3493D7 polynucleotide, or a ribozyme capable of cleaving the 3493D7 polynucleotide is useful for inhibiting the development of a cancer expressing 3493D7 in a patient. The present sequence was used in an example demonstrating suppression subtractive hybridisation (SSH)-generated isolation of a cDNA fragment of the 3493D7 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; calreticulin; antisense compound; hyperproliferative disorder; cancer; autoimmune disease; viral infection; cardiovascular disease; antisense therapy; cytostatic; immunosuppressive; virucide; antisense; phosphorothioate backbone; ss.

The invention relates to antisense compounds, compositions and methods for modulating the expression of calreticulin. The compositions comprise antisense compounds, particularly antisense oligonuclectides, targetted to nucleic acids encoding calreticulin. The antisense compound is useful for inhibiting the expression of calreticulin in human cells or tissues. It is also useful for treating a human having a disease or condition associated with calreticulin, e.g., hyperproliferative disorder e.g. cancer, autoimmune disease, viral infection or cardiovascular disease, by inhibiting expression of calreticulin. It is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. It is also used in antisense therapy. The present sequence is an antisense compound arracetted to human calreticulin. This sequence is used to study the antisense inhibition of calreticulin expression-phosphorothioate 2. MOE gapmer oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, 125P5C8; cancer, cytostatic, breast cancer, prostate cancer;

The present invention relates to compositions comprising a substance that modulates the status of 125P5C8 or a molecule that is modulated by 125P5C8. The status of a cell that expresses 125P5C8 is modulated. The composition is useful for treating cancer, particularly prostate, bladder, kidney, colon, ovary or breast cancer. The 125P5C8 protein and/or a nucleotide sequence encoding the protein is useful for immunising a mammal against cancer. The present sequence is a PCR primer shown in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human/mouse C/EBP phosphorothioate antisense oligonucleotide, SEQ ID:41
                                                                                                                     New composition comprising a substance that modulates the status of 125P5C8 gene or a molecule that is modulated by 125P5C8, useful for treating or preventing cancer that expresses or over expresses 125P5C8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, C/BBP alpha; CCAAT/enhancer-binding protein alpha; CEBPA; transcription factor; tissue development; cellular function; prollferation, differentiation, adipocyte; energy metabolism; chondrogenic; ovulation; follicular development; chordrogenic; ovulation; follicular development; hormonal metabolic regulation; paranlocyte development; cancer; hormonal metabolic regulation; granulocyte development; cancer; tumour formation; infection; infantation; expression inhibition; antisense therapy; quantitative real-time PCR primer; ss.
